This interaction involves the complete absorption of a photon and the subsequent ejection of an electron in order to conserve energy. X-rays can also experience a change of direction due to Compton scattering [13], thereby removing them from the initial beam. In this process a photon undergoes a particle-like kinematic collision with an electron, causing a change of direction and reduction in energy of the photon. Some of these scattered photons may reach the film during radiography causing fogging [8]. Other interactions exist but are not significant in the energy range of this st
