

WEATHER, WATER, AND CLIMATE OF THE LEWIS AND CLARK EXPEDITION (1803-1806)

Vernon L. Preston ¹

ABSTRACT

The first scientific records of weather, water and climate in the western United States were collected during the Lewis and Clark Expedition of 1803 to 1806 as the Corp of Discovery traversed the vast uncharted region between St. Louis, Missouri and the Pacific Ocean. In addition to general daily weather comments and events, journal writers recorded climatic regimes through detailed descriptions of flora and fauna in what are known today as the Narrative Journals. Lewis and Clark kept a separate Weather Diary that documented systematic daily observations of temperature, wind, weather conditions, and river levels. It would be nearly 60 years before systematic daily observations of weather, water and climate would begin in the region explored by this Expedition. The written observations contained in the Narrative Journals by expedition members as well as Lewis and Clark's Weather Diary have been collated and organized into one document and an overview will be presented.

INTRODUCTION

The first scientific records of weather, water and climate in the western United States were collected during the Lewis and Clark Expedition of 1803 to 1806 as the "Corps of Discovery" traversed the vast uncharted region between St. Louis, Missouri and the Pacific Ocean. Inspired by years of planning under President Thomas Jefferson, their journey established a foundation of commerce, science and knowledge of what would become the expanding domain of the United States of America (Ambrose, 1996, 68-79; Appleman, 1975; Hayes, 2001; Ronda, 2001, p. viii, 1-16; Wheeler, 1904, Vol. 1). "In its scope and achievements, the expedition towers among the major explorations of the North American Continent and the world" (Appleman, 1975, p. 3). The Expedition vastly increased the knowledge of flora, fauna, geography, geology, native peoples, commerce, trade possibilities and routes of the western wilderness.

Observations made during the journey were recorded in various journals and diaries. Of these entries, systematic climatological, hydrological, and meteorological observations were recorded in narrative style as well as in table format. The written observations contained in the Narrative Journals by the Expedition members as well as Lewis and Clark's "Weather Diary" have never been published in one complete volume. Research into the journals on the selected topic has occurred over the last three years and the data have been collated and organized. A brief overview of this effort will be presented.

HISTORY OF THE EXPEDITION JOURNALS

The journals of Meriwether Lewis, William Clark, and Expedition members are many and varied. As Donald Jackson (1978, Vol. 1, p. vii) has noted, Lewis and Clark were "the writingest explorers of their time. They wrote constantly and abundantly, afloat and ashore, legibly and illegibly, and always with an urgent sense of purpose." They recorded data into daily narrative diaries, made rough Field Notes which were translated at the end of each day by Clark, and several other documents and booklets containing, astronomy, botany, ethnology, geography, military orders, mineralogy, zoology, temperature, and weather observations. Clark produced numerous sketches and maps. Both wrote numerous letters before, during and after the expedition (Cutright, 1976).

President Thomas Jefferson did not order the keeping of journals by anyone other than the captains. In his final instructions to Lewis, however, he did suggest that "several copies of these as well as of your other notes should be made at leisure times, & put into the care of the most trust-worthy of your attendants, to guard, by multiplying them,

Paper presented Western Snow Conference 2005

¹ Warning Coordination Meteorologist, NOAA National Weather Service, 1945 Beechcraft Avenue, Pocatello, ID, 83204. (vernon.preston@noaa.gov)

against the accidental losses to which they will be exposed” (Jackson, 1978, Vol. 1, p. 62; Moulton, 1996, Vol. 10, p. xi). Four additional journals are in existence, and some previously unknown written materials from the Expedition were discovered as recently as the 1960s. There may be another one-to-three journals that have never been found. Lewis gives credence to this in his last communication to Jefferson from Fort Mandan on April 7, 1805: “We have encouraged our men to keep journals, and seven of them do so, to whom in this respect we give every assistance in our power” (Jackson, 1978, Vol. 1, p. 232).

The Journals of Lewis and Clark have been reproduced only a few times in the past two hundred years. The first issuance was under the guidance of Clark, who after the untimely death of Lewis, took control of the known journals. Nicholas Biddle (1814) produced the first edition, a two volume set, in 1814 using a general narrative paraphrase without much scientific content. However, Biddle turned the manuscript over to Paul Allen for final revision, and Allen’s name appears on the title page. Biddle may have followed a literary custom of the time, which mandated that a gentleman did not publish under his own name (Ambrose, 1996, 469-470; Moulton, 1986, Vol. 2, p. 37). Elliott Coues produced the next edition of the journals in 1893, introducing never-before published scientific discoveries made by the Expedition. It is believed that it was Coues who rekindled the nation’s interest in Lewis and Clark (Moulton, 1986, Vol. 2, p. 39). Yet Coues only produced a small subset of the full journal writings. The first full edition of known journal writings was published for the Expedition’s Centennial by Ruben Gold Thwaites. Through extensive research he discovered a number of new documents that greatly enhanced his edition. Thwaites’ (1904) eight-volume edition including copies of Clark’s cartography in a special Atlas. For the first time in history, the bulk of the Lewis and Clark journal writings were available to the public.

Other valuable but small renderings were made by Milo Quaife (1916) and Earnest Osgood (1964), and concise, abridged editions like John Bakeless’ (1947) and Bernard DeVoto’s (1953) have been published as new materials became available after 1904. New historic finds of missing journals and letters were compiled and published between 1986 and 2001 by Dr. Gary Moulton, a University of Nebraska professor, resulting in 13 volumes including an atlas and journals by Lewis and Clark, Sergeants Floyd, Gass, Ordway, and Private Whitehouse. Donald Jackson (1978) produced a two-volume set which complemented the Moulton edition and contained letters that were written before, during and after the Expedition. For further history about the journals the reader is referred to the following source documents: Coues, 1893, Vol. 1, cvii-cxxxii; Cutright, 1976; Jackson, 1978; Moulton, 1986, Vol. 2, 8-48, 530-567; and Thwaites, 1904, Vol. 1, xvii-xciii.

WEATHER, WATER & CLIMATE JOURNAL WRITINGS

Weather was a major influence for the Lewis and Clark Expedition. During their trip they experienced sweltering summer heat in Missouri and Nebraska and extreme cold and dangerous wind chill at Fort Mandan in the Dakotas. They were pelted by “pigeon egg” sized hail in Montana, and near continuous rains at Fort Clatsop on the mouth of the Columbia River which perpetuated sickness and spoilage of dwindling food supplies. Numerous Pacific Coast storms during the winter of 1805-06 produced an extreme snowpack in the Bitterroot Range of Idaho and delayed their return trip to St. Louis. Flash floods in Montana nearly swept away Clark, Sacagawea, her son and other Expedition members. Snowmelt and spring river flooding caused a dilemma on which river channel to follow. They were surprised by snowfall in June and frost in July. Members viewed the ravages of a “derecho” or tornado in twisted and blown down trees north of present-day Omaha which Clark called a “Dredfull hurican.” Strong prairie wind storms tipped their canoes, almost sunk their keel boat, and showered them with sand and dust.

Journalists recorded seasonal changes in vegetation and migrating habits of animals and birds and even changing air masses as Lewis and Clark both commented on a drier climate as their ink wells were hard to keep moist and wood writing tables split. Winter ice jams on the Missouri nearly crushed their boats and they recorded tidal changes as they proceeded from Beacon Rock, one-hundred miles inland, to the Pacific Ocean. Immense ocean waves pinned the Expedition just miles from their goal while Clark exclaimed their relief at completing their journey with the summation “Ocian in view! O! the joy.” A thousand more weather stories are buried within the pages of the journals.

Several scientifically based books have been written describing the flora and fauna and geology of the expedition (Allen, 1975; Bergon, 1989; Blume, 1999; Botkin, 1995; Burroughs, 1995; Cutright, 1976; Moulton, 1999, Vol. 12; Patient, 2003; Wells and Anzinger, 2001). Other publications describe the advance in the fields of geography and cartography (Allen, 1975; Cohen, 2002; Moulton, 1986, Vol. 1; Plamondon, 2000-2001, 2004; Schmidt, 1999) and

medical needs (Chuinard, 1998; Paton, 2001; Peck, 2002). No articles have been written on the scientific achievements of the Expedition in relationship to the systematic daily observations of climate, water and weather elements. Their daily observations were taken when only a handful of scientists were noting weather patterns. In fact, regular observations were not recorded on a daily basis until the late 1600's with the development of instruments such as the thermometer, barometer and hygrometer (Frisinger, 1983).

Scientists have used the small record of historical diaries which included basic meteorological observations to reconstruct climate patterns (Baron, 1995; Bradley and Jones, 1993; Catchpole, 1995; Druckenbrod, 2003; Glaser, 1999; Ingram, 1978; Ludlam, 1966; Pfister, 1995; Quinn and Neal, 1995). Diaries containing instrument data were very uncommon in the United States during the late eighteenth century. Thomas Jefferson and James Madison in Virginia, John Winthrop in Massachusetts, Dr. John Lining and others in South Carolina are also known to have taken daily observations during this era (Druckenbrod, 2003, p. 62). No daily science based observations were conducted across the North American Continent during the Lewis and Clark Expedition.

Only a few select writings on the Lewis and Clark expedition weather, water or climate have been published. These writings include snow conditions along the Lolo Trail (Ambrose, 1978); the inclement weather at the mouth of the Columbia River (Lange, 1979); general weather observations at select dates along the trail (Large, 1986); scientific instruments used on the expedition (Plamondon, 1991); a master's thesis on the weather conditions at Fort Mandan, ND and Fort Clatsop, OR (Burnette, 2002); a temperature examination during the journey (Solomon & Daniels, 2004); a climate assessment during the expedition period (Knapp, 2004); and the weather conditions at Fort Clatsop, OR (Miller, 2004). No other documentation related to the Lewis and Clark Expedition has been collected into one volume for use in the scientific fields of meteorology or hydrology.

Two types of data are available from the journals. The first are the "Daily Narrative Journals" which contain general descriptions of what happened each day. Lewis and Clark kept separate entries as well as other expedition members. Many times, they would copy passages from each other to preserve the record. A second set of data was entered into scientific log books which contain information on meteorology, celestial readings, flora and fauna, geology and expenses.

Lewis' writing style was that of an educated man with excellent prose and fine alliteration. Clark had a frontier writing style with numerous spelling and punctuation challenges. Lewis' journal entries begin in a field book started on the day he left Pittsburgh, August 31, 1803. His first meteorological entry was a discussion about a "thick fogg on the face of the water that no object was visible 40 paces." Clark's first known travel entries were in some of his field notes taken near the confluence of the Ohio and Mississippi Rivers. Clark's first meteorological reference was written on November 28, 1803 "This morning being verry Smokey prevents my being as acurate as I Could wish—." The same day he noted "The horozon became darkened that I could not see across the River, which appeared to windened, the Current much Swifter than usial."

In order to preserve the record, at Fort Mandan and again at Fort Clatsop, duplicate journals were made by Lewis and Clark. At other times, Clark would write two versions of his daily entries. The first entries were in his field notes, and a cleaner second version for the final bound journals. As for Lewis, his journal writing entries are much more sporadic. Many scholars have researched why Lewis' journal entries have large gaps in them. Some believe it was from fits of depression, others believe the journals may have been lost, destroyed, or misplaced. (Ambrose, 1996; Appleman, 1975; Cutright, 1976; Moulton, 1986, Vol 2) The only known reason was due to injuries he suffered from an accidental gunshot wound on August 11, 1806. Meeting Clark and the rest of the party the next day, Lewis decided he would relinquish his journal entries to Clark as wrote his last words in the journals, "I shall desist untill I recover and leave to my frind Capt. C. the continuation of our journal...This cherry...is now ripe...I have never seen it in blume." Clark's last reference was, "a fine morning, we commenced wrightin &c," entered on September 26, 1806, three days after their arrival back in St. Louis.

Journal writings are also available from three Sergeants and one Private. Sergeant Charles Floyd's entries are the shortest as he passed away near present-day Sioux City, Iowa on August 20, 1804. Floyd was the only member of the expedition to die during the journey. His entries provided a more conscientious look at daily happenings. As Moulton (1995, Vol 9, p. xviii) notes, "Floyd apparently had an eye for such details, which makes us regret all the more that he did not live to complete a record of the whole journey." He kept entries until two days before his death. Sergeants Patrick Gass and John Ordway wrote their journals from the day they left Camp Dubois, on May 14th, 1803 through

September 23rd, 1806, their arrival back in St. Louis.

Sergeant Gass' rough journal entries were edited by David McKeehan in 1807 (Gass, 1807) and was the first full account of the expedition published, against the wishes of Lewis. Gass, a carpenter, paid particular attention to physical details other journalist did not.

Sergeant Ordway's refined entries are in his own hand and provide a substantial amount of meteorological data in gaps left by other writers. With the exception of Clark's journal and the Weather Diary, Ordway's journal provides the most useful information on weather, water and climate.

The final known journalist is Private Joseph Whitehouse. As with Gass, Whitehouse had an original version which was very rough and provides some distinct language about certain incidents. It dates from May 14th, 1804 to November 6th, 1805. A paraphrased journal found in 1966 in a bookstore in Philadelphia, PA, provides entries from

Table 1. May 1805 Lewis and Clark Weather Diary (Lewis and Clark Combined Entries, Compiled by Vernon L. Preston from the Lewis and Clark Journals: Coues, 1893, Vol. 3, p. 1272, 1288-1289; Moulton, 1987, Vol. 4, 234-238; Thwaites, 1904, Vol. 6, Part 2, 189-191)

May 14th, 1804 to March 23rd, 1806. There is speculation that he may have kept a journal through the end of the journey, but nothing has been found (Cutright, 1976).

Spelling was a challenge to all journal writers and their creativity in using phonics is widely dispersed in the journals. The most diligent and faithful journal keeper was Ordway who did not miss a single entry for the 863 days of the journey. Clark was a close second with missing entries only while he was on a hunting trip February 3-12, 1805. He did, however, summarize the hunting trip experiences when he returned (Cutright, 1976).

WEATHER DIARY

Lewis and Clark began keeping a “Weather Diary,” or as written on the first day’s observation “Thermometrical Observations” on January 1, 1804 while the Corps was at Camp Dubois near St. Louis, Missouri. The Weather Diary recorded systematic daily observations at sunrise and 4 p.m. which included the following meteorological data: temperature, wind, weather conditions and river levels. Table 1 shows entries from the Month of May, 1805. Besides raw data, remarks were recorded on various weather phenomena, seasonal and climate changes, changes in flora and fauna. Table 2 shows various remarks entered in the Weather Diary for the month of May, 1805.

Data were entered in the Diary on a daily basis until May 14, 1804. After this date, gaps appear in data until September 19, 1804. Between September 19, 1804 and September 30, 1806 the two-a-day observations and remarks resumed with few interruptions. When the two parties split at Travelers Rest on their return trip, both Captains kept separate daily logs for July and portions of August. The weather notes indicate a substantial scientific record of atmospheric and hydrologic conditions for portions of the western United States that would not again have systematic daily observations for over 60 years after their trip was completed.

The only known meteorological instrument the Corps of Discovery used was a thermometer. Historians postulate Lewis purchased three thermometers in Philadelphia, PA during the Spring of 1803 as documented on a packing list. It is believed that the thermometers were made in Philadelphia, (Moulton, 1986, Vol. 2, p. 69) and Clark makes mention of a particular company that made a thermometer in his January 3rd, 1804 entry: “John Donegan (or Denegan) and Joseph Donegany (Donegani) were making thermometers in Philadelphia in 1785” (Moulton, 1986, Vol. 2, 145-146).

“Although thermometers are among Lewis’ list of requirements for the trip, there is no direct evidence that any were purchased” (Moulton, 1986 Vol. 2, p. 146). Other stories abound as to their origin. Historian Donald Jackson (1978, Vol. 1, p. 75) notes that “an undocumented family tradition, first related by Dye and renewed by Meany, declares that St. Louis physician, Antoine Saugrain, made thermometers for Lewis and Clark by scraping the mercury off the back of his wife’s mirror. Saugrain had social contacts with the explorers before and after the Expedition, but it is not likely that he made thermometers for them.”

Lewis kept temperature records on his way down the Ohio in the fall of 1803. Clark continued the practice at the Wood River (Dubois) Camp in the early months of 1804, and this lends credence to the theory that thermometers were obtained in Philadelphia and used for these observations. The last one was broken on September 3, 1805 when it was accidentally struck against a tree. (Moulton 1988, Vol 5, p. 186) The instruments must have been similar to that described by Jefferson in a request on June 5, 1804 to Isaac Briggs for two thermometers: “The kind preferred is that on a lackered plate slid into a mahogany case with a glass sliding cover, these being best exposed on exposure to the weather.” (Jackson 1978, Vol 1, p. 75) Based on notes in the Weather Diary as well as experiments conducted by Clark at Camp Dubois it is believed the thermometers were in the Fahrenheit scale.

Most observations were taken by visual means. To determine wind direction, they would stand facing the wind with a compass to determine a direction. For rise and fall of the river water, various marks were made on the bank and measured later with marked sticks, poles or chains which used the English scale of inches and feet.

Table 2. May 1805 Remarks (Compiled by Vernon L. Preston from the Lewis and Clark Journals: Coues, 1893, Vol. 3, p. 1272, 1288-1289; Moulton, 1987, Vol. 4, 234-238; Thwaites, 1904, Vol. 6, Part 2, 189-191))

1st wind violent from 12 OC. to 6 pm
 2nd snow 1 inch deep the wind continued so high from 12 oClock yesterday, untill 5 this evening that we were unable to proceed. The snow which fell last night and this morning one inch deep has not yet disappeared.— it forms a singular contrast with the trees which are now in leaf.—
 3rd hard frost last night. At four PM the snow has not yet entirely disappeared.— the new horns of Elk being to appear.
 4th the black martin makes it's appearance. The snow has disappeared. Saw the first grasshoppers today.— there are great quantities of a small blue beetle feeding on the willows.—
 5th a few drops of rain only
 6th rain very inconsiderable as usual
 8th rain inconsiderable a mear sprinkle the bald Eagle, of which there are great numbers, now have their young. The turtledove appears.
 9th The choke Cherry is now in blume.
 10th rain but slight a few drops
 11th frost this morning
 12th rain but slight
 13th do. do. do.
 14th white frost this morning
 15th slight shower
 17th the Gees have their young; the Elk being to produce their young, the Antelope and deer as yet have not.— the small species of Goatsucker or whiperwill begin to cry— the blackbirds both small and large have appeared. We have had scarcely any thunder and lightning. The clouds are generally white and accompanied with wind only
 18th a good shower saw the wild rose blume the brown thrush or mocking bird has appeared.— had a good shower of rain today, it continued about 2 hours; this is the first shower that deserves the appellation of rain, which we have seen since we left Fort Mandan.— no thunder or lightning
 19th heavy fog this morning on the river
 22nd the wind excessively hard all night— saw some particles of snow fall today it did not lye in sufficient quantity on the ground to be perceptible.—
 23rd hard frost last night; ice in the eddy water along the shore, and the water friezed on the oars this morning. Strawburies in bloom. Saw the first king fisher.
 24th frost last night ice 1/8 of an inch thick
 25th saw the kingbird, or bee martin; the grouse disappear. Killed three of the bighorned antelopes.
 26th The last night was much the warmest we have experienced, found the covering of one blanket sufficient. The air is extreemly dry and pure.
 27th wind so hard we were unable to proceed in the early part of the day
 28th a slight thundershower; the air was turbid in the forenoon and appeared to be filled with smoke; we supposed it to proceed from the burning of the plains, which we are informed are frequently set on fire by the Snake Indians to compell the antelopes to resort to the woody and mountanous country which they inhabit.— saw a small white and black woodpecker with a red head; the same which is common to the Atlantic states.—
 29th rained by little, some dew this morning.
 30th the rain commenced about 4 Oclock in the evening, and continued moderately through the course of the night; more rain has now fallen than we have experienced since the 15th of September last.
 31st but little rain. The Antelope now bring forth their young. from the size of the young of the bighorned Antelope I suppose they bring forth their young as early at least at the Elk.

SUMMARY

Very few papers and no books have been published describing the weather, water and climate during the entire Lewis and Clark Expedition. In fact, no publication has contained a complete listing all weather, water and climate entries from the journals. The author has completed research and produced the compilation of journal entries and observations to assist in scientific research of the meteorological, hydrological and climatological conditions during the Expedition at a National Oceanic and Atmospheric Administration's Technical Memorandum (NWS-WR-269). An

example of this collected data is in Table 3. The compilation includes: a meteorological synopsis of the Expedition; various scientific instruments used during the expedition; selected letters and lists made by Lewis, Clark and Jefferson; and the most influential weather events during the expedition. The American Meteorological Society is reviewing this technical memorandum and plans to publish it as part of their Historical Meteorological Monograph Series in the near future.

Table 3. Weather Diary from Friday, May31, 1805. (Combined entries, Compiled by Vernon L. Preston from the Lewis and Clark Journals (Moulton, 1987))

but little rain. The Antelope now bring forth their young. from the size of the young of the bighorned Antelope I suppose they bring forth their young as early at least at the Elk.

Daily Narrative Journals

Lewis soon after we got under way it began to rain and continued until meridian when it ceased but still remained cloudy through the balance of the day. The obstructions of rocky points and riffles still continue as yesterday; at those places the men are compelled to be much in the water even to their armpits, and the water is yet very cold, and so frequent are those points that they are one fourth of their time in the water. The hills and river Cliffs which we passed today exhibit a most romantic appearance...horizontal stratas of white free-stone, on which the rains or water make no impression. The water in the course of time in descending from those hills and plains on either side of the river trickled down the soft sand cliffs and worn it into a thousand grotesque figures, which with the help of a little imagination and an oblique view at a distance, are made to represent elegant ranges of lofty freestone buildings, having their parapets well stocked with statuary; columns of various sculpture both grooved and plain, are also seen supporting long galleries in front of those buildings; in other places on a much nearer approach and with the help of less imagination we see the remains or ruins of elegant buildings, some columns standing and almost entire with their pedestals and capitals. As we passed on it seemed as if those scenes of visionary enchantment would never have an end...So perfect indeed are those walls that I should have thought that nature had attempted here to rival the human art of masonry had I not recollected that she had first begun her work. The river today has been from 150 to 250 yds. wide.

Clark a cloudy morning. Soon found it very laborious as the mud stuck to my moccasins & was very slippery. Soon after we got under way it began to rain and continued moderately until about 12 o'clock when it ceased, & continued cloudy the balance of the day. The Hills and river Cliffs of this day exhibit a most romantic appearance...in many places this Sand Stone appears like ancient ruins some like elegant buildings at a distance, some like Towers &c. &c. Remind us of some of those large Stone buildings in the United States. As we passed on it seemed as if those scenes of visionary enchantment would never have an end; for here it is too that nature present to the view of the traveler vast ranges of walls of tolerable workmanship, so perfect indeed are those falls [walls] that I should have thought that nature had attempted here to rival the human art of masonry had I not recollected that she had first begun her work. The river rises a little. The water is yet very cold. Little timber on the river to day. River less muddy than it was below.

Gass a cloudy morning. About 11 o'clock it began to rain slowly, and continued raining two hours, when it cleared up. The rocky peaks...appear like the ruins of an ancient city.

Ordway a Cloudy morning. It continued to rain moderately until about 12 o'clock when it ceased & continued cloudy. The Stones on the edges of the river continue to form very considerable rapids. We find them difficult to pass. The River rises a little it is from 150 to 250 yards wide

Whitehouse cloudy weather this morning. About 11 o'clock AM it began to rain, and rained moderately for some time. The current of the River ran very strong, the whole of this day. In the Evening, the weather cleared off, and became pleasant.

Note: Quoted text is from the manuscript of the Lewis and Clark Expedition journals by Moulton (1986-2001).

ACKNOWLEDGMENTS

The author is indebted to Dean Hazen, Science and Operations Officer for the National Weather Service in Pocatello, Idaho for discussions and assistance on various aspects of this work and review of manuscript. The author is also appreciative of Tanja Fransen, Warning Coordination Meteorologist for the National Weather Service in Glasgow, Montana for urging me to continue my pursuit of the meteorological history along the trail of the Lewis and Clark Expedition.

The Lewis and Clark Expedition (1804–1806) was the first United States transcontinental expedition and second overland journey to the Pacific coast, following the 1793 expedition by the Scotman Alexander Mackenzie, who reached the Pacific from Montreal. Commissioned by President Thomas Jefferson following the acquisition of vast western territories from France known as the Louisiana Purchase, the expedition, called the Corps of Discovery, was led by Captain Meriwether Lewis, a frontiersman and Lewis and Clark expedition. On 18 January 1803, President Thomas Jefferson delivered a secret message to both houses of Congress. "As the continuance of the act for establishing trading houses with the Indian tribes will be under the consideration of the Legislature," he advised, "I think it my duty to communicate the views which have guided me in the execution of that act." For the Indians, the Lewis and Clark Expedition foreshadowed old-fashioned imperialism, not an "Empire of Liberty." See also Louisiana Purchase; American Indian Policy, 1787–1830; American Indian Relations, 1763–1815; American Indian Removal; Presidency, The: Thomas Jefferson .

Barth, Gunther, ed. *The Lewis and Clark Expedition: Selections from the Journals, Arranged by Topic*. The Lewis and Clark Expedition began in 1804, when President Thomas Jefferson tasked Meriwether Lewis with exploring lands west of the Mississippi River that comprised the Louisiana Purchase. The expedition provided new geographic, ecological and social information about previously uncharted areas of North America. While they had failed to identify a coveted Northwest Passage water route across the continent, they had completed their mission of surveying the Louisiana Territory from the Mississippi River to the Pacific Ocean, and did so against tremendous odds with just one death and little violence.
