

The Polar Cusp #2012 #Springer Science & Business Media, 2012 #J.A. Holtet, A. Egeland #436 pages #9789400952959

The polar cusps are essentially two holes in our magnetosphere. Here, Earth's magnetic field lines funnel the solar wind downwards, concentrating its energy before injecting it into Earth's atmosphere, where it mixes and collides with particles of Earthly origin. Earth's magnetosphere, showing the northern and southern polar cusps. Credits: Andriy, ya Space Center/Trond Abrahamsen. The cusp stays positioned at local noon wherever the Sun is directly overhead. As Earth turns, particles are funneled into different regions of the atmosphere like a tube of icing squirted onto a rotating cake.
