# Contents

Preface xiii

## **1 The Origin of Eukaryotes 1**

### **Entry into the DNA World 4**

A viral origin of DNA? 6

Membranes early or late? 7

### **The Three Domains of Cellular Life 9**

Tree, ring, or web of life? 13

Eukaryotic gene acquisition from endosymbionts 14

The unity of the eukaryotes 15

### **The Stem Eukaryote 16**

### **The Eukaryotic Radiation 18**

The unikonts and bikonts 21

A eukaryotic big bang? 22

### **Genome Repatterning and the Eukaryotic Radiation 23**

### **A Synopsis of the First 2 Billion Years of Biology 26**

## **2 Genome Size and Organismal Complexity 29**

- Genome Size and Complexity 30
- The Selfish-DNA and Bulk-DNA Hypotheses 32
- The Metabolic Cost of DNA 34
- Directional Mutation Pressures on Genome Size 35
- Population Size and the Mutational Hazard of Excess DNA 39

## **3 The Human Genome 43**

- Gene Number 43
- Introns and Exons 49
- Regulatory DNA 51
- Mobile Genetic Elements 56
  - LINEs and SINEs 57
  - LTR elements 59
  - Transposons 60
- Pseudogenes 60
- The Unique Trajectory of Human Evolution 63

## **4 Why Population Size Matters 69**

- Random Genetic Drift at a Neutral Locus 70
- The Effects of Selection 74
- The Importance of Linkage 76
  - The theory of genetic draft 78
  - Empirical considerations 81
- The Three Genomic Perils of Evolving Large Body Size 83
  - Smaller population size 84
  - Higher mutation rates 84
  - Reduced recombination in large genomes 86

**The Global Effective Population Sizes of Species 90**

Sources of bias 92

Resolution of the “paradox of variation” 95

**Mutation as a Weak Selective Force 97**

## **5 Three Keys to Chromosomal Integrity 101**

**Origins of Replication 102**

ORI specification 104

Evolutionary consequences 105

**Centromeres 107**

The centromeric-drive hypothesis 109

Centromere positioning 112

Centromere definition 113

**Telomeres 116**

## **6 The Nucleotide Composition Landscape 121**

**The Molecular Spectrum of Mutational Effects 122**

**Biased Gene Conversion 127**

**Evolutionary Consequences of Replication 133**

**Isochores 136**

**The Nonadaptive Basis of Genome-Wide Nucleotide  
Composition Variation 139**

**Codon Usage Bias 141**

Prokaryotes 144

Eukaryotes 146

Unsolved problems 149

## **7 Mobile Genetic Elements 151**

**Non-LTR Retrotransposons 153**

The *IR* system of hybrid dysgenesis 157

**LTR Retrotransposons 159**The *gypsy* element 163**Transposons 164**The *P* element 166**Rates of Insertion and Fitness Effects 167****Regulation of Mobile Element Activity 169**

The opportunity for self-regulation 170

Host-encoded mechanisms for mobile element containment 172

**The Population Biology of Mobile Elements 174**

Conditions for establishment 174

Conditions for element number stabilization 179

Insights from population surveys 181

Mobile elements and species extinction 185

**Positive Effects of Mobile Element Insertions 189****8 Genomic Expansion by Gene Duplication 193****The Evolutionary Demography of Duplicate Genes 194**

Origins of segmental duplications 199

Whole genome duplication 202

**Mechanisms for the Preservation of Duplicate Genes 209**

Neofunctionalization 209

The masking effect of duplicate genes 213

Subfunctionalization 215

**The Fates of Duplicated Protein Sequences 219**

Patterns of molecular evolution 220

**The Case for Subfunctionalization 225****Speciation via the Divergent Resolution of Duplicate Genes 228****9 Genes in Pieces 237****The Spliceosome(s) 238****The Introns Early–Introns Late Debate 242**

<b>A Group II Origin?</b>	<b>244</b>
<b>Mechanisms of Origin and Loss</b>	<b>247</b>
<b>The Intrinsic Cost of Introns</b>	<b>251</b>
<b>Introns and Population Size</b>	<b>253</b>
<b>Rates of Intron Gain and Loss</b>	<b>256</b>
<b>Adaptive Exploitation of Introns</b>	<b>262</b>
Modifiers of the recombination rate	262
Alternative splicing	263
Messenger RNA surveillance	265

## **10 Transcript Production 271**

<b>Transcription and Translation Initiation</b>	<b>272</b>
<b>The Premature Translation Initiation Problem</b>	<b>276</b>
<b>Transcription Termination</b>	<b>282</b>
<b>The Deployment of <i>trans</i> Splicing</b>	<b>287</b>
<b>Evolution of Modular Gene Organization</b>	<b>292</b>
The passive emergence of modularity	294
The demise of operons	297

## **11 Expansion and Contraction of Organelle Genomes 303**

<b>Establishment and Stabilization of Organelles</b>	<b>305</b>
The early stages of mitochondrial evolution	305
Intergenomic transfer	308
The origins of plastids	310
<b>Genome Content and Organization</b>	<b>312</b>
<b>The Population Genetic Environment</b>	<b>316</b>
Mutation	317
Transmission and recombination	321
Effective population size	323

**Mutation Pressure and the Diversification  
of Organelle Genomes 326**

The proliferation of noncoding DNA 327

Modifications of the genetic code 330

Messenger RNA editing 333

**Muller's Ratchet and the Mitochondrion 336**

**Insights from More Recent Endosymbioses 342**

## **12 Sex Chromosomes 347**

The Origins of Sex Chromosomes 349

The Population Genetic Environment 351

Degeneration of the Y Chromosome 354

Retailoring the X Chromosome 358

## **13 Genomfart 363**

The Origins of Modern Evolutionary Theory 364

Evolution as a Science in the Post-Darwinian World 366

Nothing in Evolution Makes Sense Except in the Light  
of Population Genetics 370

The Passive Emergence of Genomic Complexity  
by Nonadaptive Processes 372

Do the Roots of Organismal Complexity Also Reside  
in Nonadaptive Processes? 377

An Entrée to Understanding the Origins of Genomic Determinants  
of Organismal Complexity 380

Evolvability 386

Closing Comments 389

**Glossary 391**

The Origins of Genome Architecture has been added to your Cart. Add to Cart. Buy Now. All the major conceptual topics in molecular evolution are covered (e.g. the nearly neutral theory of evolution, evolution by drift, evolution of the genome and various genomic features such as introns, UTRs, transposable elements ) in great depth. Although much of theoretical mathematics are also covered, these can be easily ignored by those who are not versed in statistical mathematics. Origins of segmental duplications 199 Whole genome duplication 202. Mechanisms for the Preservation of Duplicate Genes Neofunctionalization 209 The masking effect of duplicate genes Subfunctionalization 215. 213. Such uncertainty is largely a consequence of our rudimentary understanding of the genetic architecture of complex traits. At the level of the genome, however, we can no longer hide from the facts. Over the past twenty-five years, molecular geneticists have revealed a huge amount of information about the structural and functional aspects of gene architecture and expression, to the point that we really do know the raw material upon which evolutionary forces operate. The Origins of Genome Architecture. By Michael Lynch. Sunderland (Massachusetts): Sinauer Associates. \$59.95. xvi + 494 p.; ill.; author and subject indexes. 9780878934843. 2007. Richard J. Mural. Richard J. Mural. As a whole, Origins of Genome Architecture represents a serious, valiant, and highly scholarly attempt at making sense of the new data provided by the genomic revolution. To that aim, Lynch deploys the full array of conceptual tools that make up the modern synthesis paradigm in evolutionary biology." - Massimo Pigliucci, Science. "This volume would be an excellent foundation for an upper-level undergraduate course or a graduate seminar. It has become increasingly clear that a blind reliance on the explanatory power of natural selection has led to a lot of "sloppy thinking"
